

JACK AND ALICE NEWTON – Arizona & B.C., Canada

Jack and Alice Newton are true ambassadors of amateur astronomy. They are internationally recognized for their many contributions to cold camera photography in the 1970's and 80's, frontier RGB color CCD imaging in the 90's and their world-class solar imaging, second to none, most recently. They have set a high standard for the astronomy bed and breakfast concept starting with Chiefland and Vancouver Island, Canada. Their current Osoyoos British Columbia, Canada Bed and Breakfast is the pinnacle of an astronomical resort where they host guests from all over the world. Earlier this decade, they created the Arizona Sky Village with the vision to “create an environment for discovery and learning” in some of the darkest skies in the world. On top of all of this, Jack has co-discovered over 25 supernovas and published numerous images, had an asteroid “30840 Jackalice” named and has traveled extensively. Jack will share with us his specialized techniques for producing world-class images he has captured with his unique cooled DSLR Canon camera. Alice will entertain us with her accounts of traveling with her “astronut” (as she refers to him) husband Jack to exotic, faraway places.
